RADAR SecurePIC

Efficient photo capture of any patient document.

eRAD®

RADAR SecurePIC enables faster and more accurate capture of patient information. Patients securely send photos of prescriptions, insurance cards, referral forms—any document—for immediate, direct transfer to the patient folder.

Streamline registration with accurate capture of patient information—the first time. Prompted by an easy-to-follow request directly from your system, patients can snap a photo of any document on a mobile phone and send it to an eRAD RIS user. All communication is secure, and the photos go directly into the patient record.

Along with greater efficiency and elimination of paper bottlenecks, you gain confidence in the accuracy of clinical information. SecurePIC supports improved continuity of care, which translates into increased potential for positive outcomes.

FEATURES

▶ **Easy adoption for all users**
SecurePIC generates step-by-step instructions when sending a photo capture request. Build loyalty by making it easier and faster for patients to register. Patients are engaged, with no worries about communication lapses.

▶ **Bi-directional, secure communication**
Requests to the patient for a photo capture and responses from the patient are both HIPAA-compliant, secure communication. You gain a productive, efficient flow of information with less paper.

▶ **Seamless workflow**
Requests are sent from the patient record and, once received, requested document photos are transferred directly into the patient folder. The capture of information prior to the visit can reduce wait times and optimize processes like registration and collection.

> "With eRAD, we get the interoperability that we can't find with other vendors. We take advantage of mobile devices and authentication to engage patients and referring physicians directly."
